OFFSHORE INJURY AND INCIDENT STATISTICS 2010/2011

**Health & Safety Executive
Hazardous Installations Directorate
Offshore Division (OSD)**

Preface

This is the tenth report in a series of HID Statistics reports covering offshore injury and incident statistics, which continues from the previous OTO series. It is the fifteenth under the Reporting of Injuries, Diseases and Dangerous Occurrences Regulations 1995 (RIDDOR), and presents data on injuries, diseases and incidents reported for the period 1 April 2008 to 31 March 2011.

Copies of this report can be downloaded from HSE's website at

<http://www.hse.gov.uk/offshore>

Copies of this report can also be obtained from:

2. KPI-3 Safety Critical Maintenance Backlog	44 - 45

SUMMARY

This report contains details of offshore accidents, dangerous occurrences and ill health reported to HSE from 1 April 2010 to 31 March 2011, with summarised data back to 1995/96 for comparison.

The main points are:

- No fatalities arising from offshore work activities regulated by HSE were reported in 2010/11 for a fourth successive year.
- 42 major injuries were reported, compared to 50 in 2009/10 and 30 in 2008/09.
- The major injury rate per 100,000 workers fell from last year's figure of 188 to 152 returning to the levels last seen in 2007/08. The combined fatal and major injury rate is the same as the major injury rate.
- 107 'over-3-day' injuries were reported, a reduction of 3 compared to the previous year. The over-3-day injury rate decreased from 413.6 per 100,000 workers to 386.8 – a decrease of 6.5% compared to 2009/10. This is 70.1% lower than the peak of 1293 in 1995/96.
- 430 dangerous occurrences were reported, compared to 434 in 2009/10, a decrease of 4. This is 43.7% less than the peak of 764 in 2000/01.
- The estimated offshore workforce was 27,660 compared to 26,598 in 2009/10 - an increase of 4%.
- The 'maintenance/construction' work process environment continued to produce the highest number of 'all injuries' this year, followed by 'deck operations'. 'Maintenance/construction produced the most 'major' injuries followed by 'Production' activities.
- 'Struck by moving objects' produced the most injuries in a single category followed by 'injuries from handling, lifting or carrying', 'slips, trips and falls', and 'falls from height'. These four categories account for 83% of all injuries. Injuries from slips, trips and falls, including falls from height, account for 38.1% of all major injuries. Approximately three quarters of major injuries were to limbs.
- The ratio of over-3-day to major injuries increased by 15.9% in 2010/11 to 2.55. This reflects the reduction in the proportion of major injuries among the total of all reportable injuries compared to the previous year and continues the overall downward trend in reportable injuries over the last five years.
- This year the three-year rolling average of injury rate for combined fatal and major injuries fell compared to last year and continued the overall downward trend over the past 10 years. The three-year rolling average rate for over-3-day injuries continued to decline.

INTRODUCTION

1.1 This report covers the period from April 2010 to March 2011, with summary data from 1995/96 included for comparison. It is based on incidents reported under the Reporting of Injuries, Diseases and Dangerous Occurrences Regulations 1995 (RIDDOR)¹. For offshore operations, this covers incidents directly affecting offshore installations or workers or visitors on offshore installations². It also includes certain diving operations in connection with operations on an offshore installation³.

1.2 Commentary is provided on the statistics as a whole as well as more detailed analysis of major injuries. Annex 1 contains tables and graphs of the 2010/11 statistics.

1.3 An additional commentary is provided at Annex 2 relating to monitoring activities undertaken by the UK offshore oil and gas industry's representative body Oil & Gas UK (OGUK) in respect of Key Performance Indicators.

1.4 Provisional headline data on fatalities, injuries, and other reportable incidents was published on the HSE website in the Offshore Safety Statistics Bulletin 2010/2011 (<http://www.hse.gov.uk/offshore/statistics.htm>) in August 2011. This data was based on analysis of data conducted at quarterly intervals throughout the operating year. Data in the bulletin is regarded as provisional due to the potential for late submission or amendment of reported incident data. The data contained in this full annual report for 2010/2011 has undergone a detailed review for the whole operating year and contains a few minor amendments to the headline statistics contained in the bulletin.

1.5 OSD commissioned a review of the pre-1996/97 data to reclassify injuries from that period in line with the RIDDOR requirements. All data in this report now conforms to the RIDDOR classification. Care should be taken in making comparisons, particularly where small numbers of incidents are involved, to avoid reading too much significance into variations.

1.6 One fatality occurred in 2010/11 when a worker collapsed during a working shift. The incident was not caused by a work accident and was not reportable under RIDDOR so it is not included as a fatality statistic.

¹ Reportable injuries and dangerous occurrences are defined in regulation 3 of RIDDOR. Further description of 'Major Injuries' is provided in RIDDOR under Schedule 1. Reference to over-3-day injuries in this annual report includes all other RIDDOR reportable injuries that are less severe than Major Injuries. Description of reportable Dangerous Occurrences is provided in Schedule 2.

² The report does not include incidents arising from marine activities that are not directly connected with offshore operations (e.g. vessels or rigs in transit) or air transport activities (including transport to, from or between installations), except incidents affecting helicopters whilst located on an installation which are included if they occur. The report does include offshore wells and most activities in connection with them, as well as offshore pipelines, pipeline works and certain activities in connection with pipeline works. Incidents on offshore wind farms are included.

³ Whilst HSE Offshore Division retains responsibility for all aspects of offshore diving and inshore commercial diving, statistics stated in this report are for offshore diving and diving support activities associated with an offshore installation only.

COMMENTARY

Population

2.1 Injury rates are calculated using offshore population data from the industry's Vantage personnel tracking system. Up to and including 2003/04, data from the Inland Revenue was used. For 2010/11, the estimated offshore population (based on total number of hours worked divided by 2000 hours per worker year) was 27,660, a 4% increase compared to the previous year's figure of 26,598.

Fatal injuries

2.2 There were no fatal injuries during 2010/11 for a fourth consecutive year.

Major injuries

2.3 The number of major injuries (42) decreased by eight over the previous year. This figure includes 3 major injuries to workers working on wind farms. The major injury rate per 100,000 workers fell 19% to 152. Since there were no fatalities, the combined number of fatal and major injuries also fell by eight to 42 resulting in a reduction in the combined fatal and major injury rate per 100,000 workers to 152.

Over-3-day injuries

2.4 The number of over-3-day injuries (107) decreased 2.73% compared to 2009/10. The over-3-day injury rate also decreased by 6.5% to 386.8. This is a new low figure reflecting the continuing reduction in the number of injuries in a consistently high offshore working population.

Ratio of over-3-day to major injuries

2.5 Table 4 and Figure 5 show the ratio of over-3-day to major injuries for the last fifteen years. The rise in the ratio for 2010/11 reflects the greater fall in major injuries against only a small reduction in over-3-day injuries for the year. Overall there has been a decline in the total number of reportable injuries in 2010/11, however it should be noted that conclusions derived from the ratio should be tempered by the extent to which over 3-day injuries might have had the potential to lead to major injuries if less fortunate circumstances had occurred and vice versa.

Three-year rolling averages

2.6 Three-year rolling averages smooth out variations and give a clearer picture of overall trends - see Tables 3 and 3a and Figures 4 and 4a.

The three-year rolling average for the combined number of fatal and major injuries showed a small reduction (1.5%) in 2010/11 reflecting the moderate fall in major injuries for that year. The average for the fatal and major injury rate, which takes account of the working population, has also fallen 1.5% over the last 12 months. This is largely influenced by both the reduction in the number of major injuries during 2010/11 and the larger workforce population for that year. The rolling average for over-3-day injuries has fallen by 10.3% however; the over-3-day injury rate rolling average has shown a 9.6% fall to a new low of 432.8 per 100,000 workers and reflects the consistent fall in over-3-day injuries over the last five years.

Details of injuries

Nature of injury

2.7 Table 5 categorises injuries by severity and nature of injury, and Figures 6 and 6a illustrate their distribution. The most frequent types of all injuries were fractures (30.9% - 46 injuries), sprains and strains (26% – 39 injuries), contusions (10.7% - 16 injuries) and lacerations (10% - 15 injuries). For major injuries, fracture was the most commonly occurring type, with 27 incidents which represents 64% of all major injuries (42). For over-3-day injuries, sprains and strains were the most common type of injury, with 38 incidents (35.5% of over-3-day injuries). Other frequent types of over-3-day injuries included fractures (19 incidents – 17.8%), contusions (15 incidents - 14%) and lacerations (12 incidents – 11.2%).

Part of body injured

2.8 Table 6 and Figures 7 and 7a provide information on the site of injury. The upper limb⁴ accounted for 51% (76) of all injuries for 2010/11 and the lower limb accounted for 26.2% (39). The torso accounted for 12.1% (18) of all injuries. The number of head injuries (9) remained unchanged and accounted for 6% of the total. Injuries to the limbs accounted for 33 (78.6%) of all major injuries.

For over-3-day injuries, injuries to the limbs accounted for 82 injuries (76.6% of over-3-day injuries). There were 57 incidents (53% of over-3-day injuries or 69.5% of over-3-day limb injuries) affecting the upper limbs and 25 (23.4% of all over-3-day injuries) to the lower limbs. Of all upper limb injuries, 45 (59.2%) were attributed to injury to one or more fingers or thumbs (of which 80% were over-3-day injuries). Injuries to the torso accounted for 15% of all over-3-day incidents, with 16 incidents reported.

Kind of accident

2.9 Table 7 and Figures 8 and 8a record the breakdown of the kind of accident against severity of injury. 37 (24.8%) of all injuries were associated with handling, lifting or carrying activities, 41 (27.5%) from being struck by moving, flying or falling objects, of which 15 resulted in major injury. 25 incidents (16.8% of all injuries) were as a result of slips, trips or falls at the same level and a further 21 (14.1%) involved a fall from height, resulting in a total 46 (30.9%) of all injuries being associated with slips, trips and falls of all types.

Age of injured person

2.10 Table 8 and Figures 9 and 9a show the age of the injured persons. The majority of injuries (66.4%) were spread between ages ranging from 25 to 49 years of age, with the 30-34 year band recording the highest number of injuries with 27 (18.1%) incidents. The 35-39 year age band recorded the highest number of major injuries (7 incidents, 16.7% major injuries) closely followed by 30-34 year band with 6 incidents (14.3%).

⁴ Upper limb includes the fingers and the thumb, hand and wrist.

Work Process Environment

2.11 Table 9 and Figures 10 and 10a describe the type of activity being carried out when the incident occurred. Work Process Environment categories were introduced for offshore incidents from April 2001. Prior to that, categories under 'operation' were used. Any direct comparisons of these categories should therefore be used with care. Most injuries occurred in the 'maintenance and construction' environment (55 incidents, or 36.9% of all injuries). The maintenance and construction environment also had the most major injuries (16 incidents, or 38.1% of all major injuries - a small rise compared to last year (15) despite the significant fall in major injuries for the year), followed by production and deck operations which produced 9 (21%) and 8 (19%) major injuries respectively.

Agent of Accident

2.12 Table 10 and Figures 11 & 11a give information on the agent of accident against severity of injury. 34.2% of all injuries (51 incidents) involved 'surfaces, structures and building access equipment'. 24 incidents (16.1% of the total) involved 'conveying, lifting storage systems and hand-held pushed/pulled transport equipment'. The majority of major injuries involved two categories, 'surfaces, structures and building access equipment' (38.1%) and 'machines and equipment – not hand held tools' (16.7%). 'Conveying, lifting storage systems and hand-held pushed / pulled transport equipment' accounted for 14.3% of major injuries.

Reportable Diseases

2.13 Table 11 indicates there were 7 cases of disease or ill health reported in 2010/11, compared with 10 in 2009/10. There were 5 cases of chickenpox and 1 case each of mumps and decompression illness.

Dangerous Occurrences

2.14 The total of 430 reported dangerous occurrences (DO) for 2010/11 represents a modest 1% decrease compared to the figure for 2009/10 (434 incidents). The more frequently occurring types of dangerous occurrences reported in 2010/11 were:

- DO type 01 (failure of lifting machinery, etc.) with 27 events accounted for 6.3% of incidents
- DO type 13 (well related activities) accounted for 35 events - 8.1%
- DO type 73 (release of hydrocarbon) accounted for 36% of all incidents (155).
- DO type 74 (Fire or explosion not linked to a loss of petroleum hydrocarbon) increased to 37, representing 8.6% of the total.
- DO type 77 (station-keeping, dropped objects and weather) accounting for 26% (112).

Figure 12 provides a summary of hydrocarbon release dangerous occurrences by severity with Figure 12(a) showing the number of well related incidents since 2003/04.

A further five events recorded under other DO type codes also related to well activity making an adjusted total of 40 DOs (9.3%) that were well related being reported in 2010/11, none of which resulted in a major release of hydrocarbon.

- 30 of the reported well related events either did not involve release of fluids or, if a release occurred it only involved a release of brine.
- 24 incidents involved a kick resulting in activation of a blowout preventer or diverter system to control flow from the well.
- 3 incidents (included in Type 13(e)) involved a failure of blowout preventer equipment after initial installation.

2.15 Tables 13,14,15 and 16 provide a summary of dangerous occurrences for types DO 01 (Failure of lifting machinery), DO 78/79 (Collision/Possible collision offshore), DO 80/81 (Subsidence or collapse of seabed/Loss of stability or buoyancy) and DO 82 (Evacuation of an installation) over a ten year period.

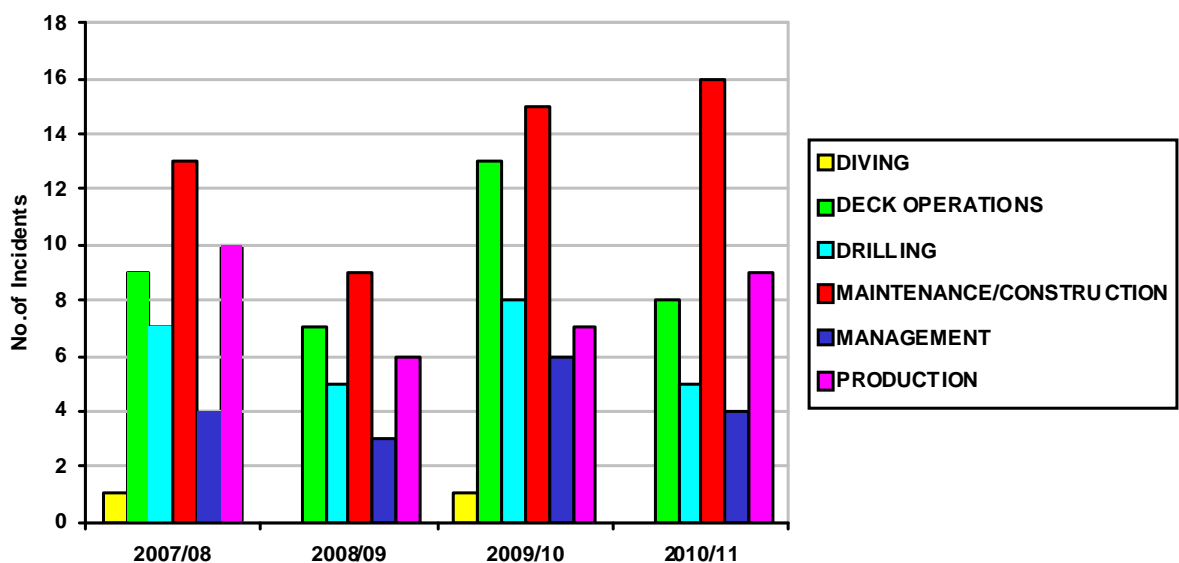

- Fig 13 shows incidents involving the failure of lifting machinery to be in a steady decline since 2001/02. The 2010/11 figure (27) is the lowest recorded over the decade and is a 29% reduction compared to 2009/10 (38). Overall type DO 01 accounted for 6% of all dangerous occurrences in 2010/11.
- Fig 14 shows the split between collision and possible collision incidents offshore. Collisions account for the majority of these incidents since 2001/02 at 63 compared to only 19 for possible collisions over the same period. The highest level reported was in 2007/08 (12) with a gradual reduction since, falling to one of the lowest levels in 2010/11 (4).
- DO type 80 (Subsidence or collapse of seabed) and DO type 81 (Loss of stability or buoyancy) are illustrated in Fig 15. The total of both types reported since 2001/02 is 5 with 4 of these occurring 2008/09 onwards and this after several years without incident.
- Fig 16 shows the number of installation evacuations (DO type 82) reported since 2001/02, a total of 28 to 2010/11. Early years show relatively low figures with modest reductions in incidents to 2006/07. Of the 10 year total (28), 19 occurred from 2007/08 an average of approx 1% of the total of dangerous occurrences each year.

FURTHER ANALYSIS OF MAJOR INJURIES

3.1 This section compares the numbers of reported major injuries for the last four years and examines the links between the main data categories and other aspects.

Major Injuries by Work Process Environment

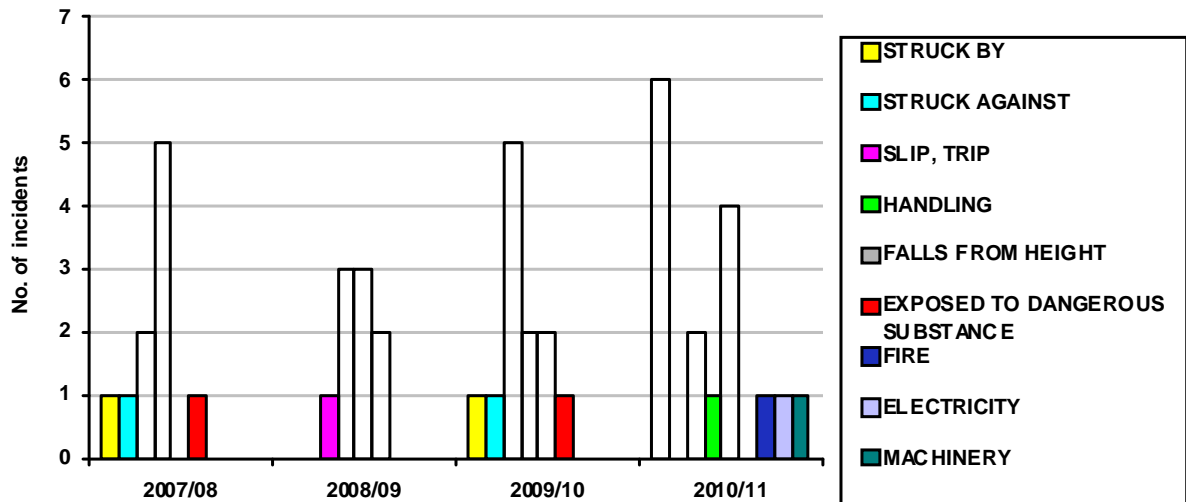

3.2 The chart below shows the numbers of reported major injuries over the last four years (166), sorted by the main work process environments. 'Maintenance/Construction' injuries (53) and 'Deck Operations' (including air and sea transport) injuries (37) have dominated the last 4 years with 54.2% of all major injuries, followed by 'Production' (32) and 'Drilling' (25) activities which account for a further 34.3%.

Major Injuries in Offshore Maintenance & Construction

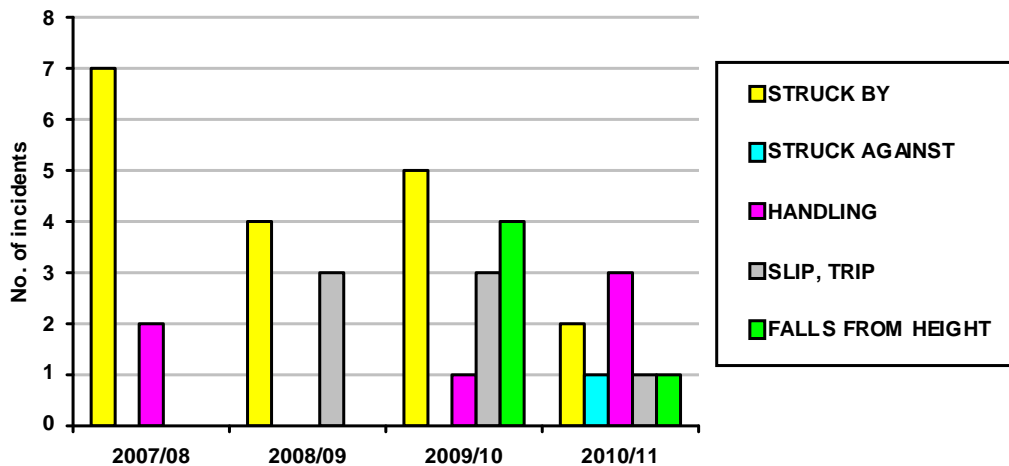

3.3 The chart below shows the relationship between 'offshore maintenance/construction' and a subset of common kinds of accident.

The total number of major injuries in maintenance and construction activities (16) for 2010/11 rose by one compared to the previous year (15). The dominant kind of incident was struck by moving, flying or falling objects (6) followed by falls from height (4) and slips, trips and falls (2). Slips, trips and falls and falls from height were also predominant types of incident in the previous year 2009/10. Ten injuries resulted with fractures and one resulted in amputation. Six incidents involved injury to hands, fingers or upper limbs, five involved ankle or lower limbs and three to eyes and head.

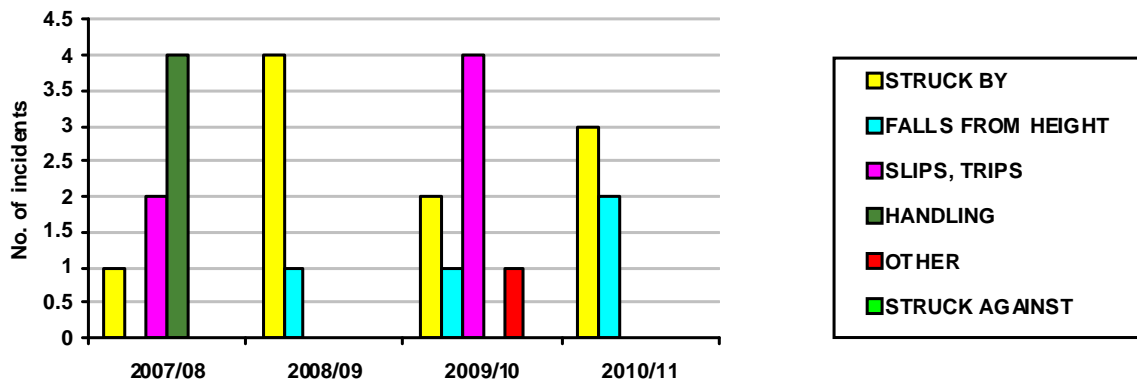

Major Injuries in Offshore Deck Operations (including Transport)

3.4 The chart below shows the links between offshore deck operations and kind of accident. Major injuries in this discipline (8) fell by 5 from last year and represent 19% of all major injuries for the year. Historically, deck operations have been a significant contributor to major injury totals, with deck operations injuries occurring over the last four years accounting for 22% of all major injuries. In 2010/11, six major injury incidents arising from deck operations resulted in fractures with the remaining two being amputations.

Major Injuries in Offshore Drilling / Workover

3.5 The chart below shows the links between 'offshore drilling / workover' and kind of accident.

Major injuries in this discipline account for around 15% of all reported major injuries over the 4 year period. The total for 2010/11 was five, with 'Struck By' being the largest category having three instances. Two injuries associated with drilling and workover resulted in fractures to ankles whilst a further two resulted in finger amputation.

Number of major injuries

3.6 42 major injuries were recorded, 8 less than 2009/10. The injury rate fell by 19%, reflecting the reduction in the number of major injuries compared to the previous year's figure and the rise in hours worked.

3.7 The 'maintenance and construction' discipline continues to be a leading contributor to major injuries with 16 (38%) such injuries occurring in 2010/11 compared to 15 (30%) the previous year. There were reductions in the number of major injuries in all but two WPE categories with 'production' being the other increase rising from 7 (14%) in 2009/10 to 9 (21%) in 2010/11.

Age of injured person

3.8 The average age of injured person for all offshore major injuries was around 41 years of age over the four-year period.

Nature and Site of injury

3.9 'Fracture' continues as the most frequently recorded single kind of major injury accounting for 64% of major injuries in 2010/11. Fracture is also the

highest occurring outcome of all injuries (i.e. including over-3-day injuries) with 30.9% of all injuries. The majority of fractures classed as major injuries were to the hand/wrist or foot/ankle or limbs. Amputations increased to five major injuries, all involving loss of finger parts.

Kind of Accident

3.10 The main single category for 'kind of major accident' during 2010/11, was 'Struck by moving, including flying or falling object' with 15 incidents (35.7% major injuries) followed by 'Fall from height' with 10 incidents (23.8% of major injuries). Taken together, slips trips and falls of all types accounted for a total of 16 major injuries (38% major injuries).

Other trends

3.11 Both the number of major injuries and over-3-day injuries decreased in 2010/11 (42 and 107 compared to the previous year 50 and 110 respectively). Overall the total number of all reportable injuries for the year is therefore down by 11 (6.9%) compared to the previous year.

HYDROCARBON RELEASES (HCRs)

4.1 This section provides outline details relating to HCRs between 1998/99 and 2010/11. Fig. 12 shows the split between releases described as 'Minor' and those that are described as either 'Major' or 'Significant', based on severity classification definitions⁵ agreed with the offshore industry.

4.2 RIDDOR reportable HCRs are unintended releases of petroleum gas or liquids from an offshore installation that either result in fire or explosion or require action to prevent or limit the consequences of a potential fire or explosion if ignited, or which have the potential to cause death or major injury. During 2010/11 five releases (i.e. 3% of all reported HCRs) were reported as ignited events.

4.3 Detailed supplementary data (upon which Fig 12 is based) relating to HCRs reported under RIDDOR are voluntarily reported to HSE by offshore operators on Form OIR/12. Only those releases reported via Form OIR/12 are shown in Figure 12. Note that only releases occurring on an installation or within the 500 meter safety zone surrounding the installation are covered by the reported data in this report.⁶

4.4 The details below are based on dangerous occurrences involving a release of hydrocarbon and are predominantly dangerous occurrence code 73 events. However a few events reported under other dangerous occurrence codes may also involve a release of hydrocarbon for which a Form OIR/12 has been submitted and which are therefore included in the details below. The reported number of hydrocarbon releases (DO73) shown on Table 12 may therefore differ slightly to the numbers reported below and in Figure 12.

4.5 Few reported HCRs gave rise to incidents which could, in whole or in part, be considered as "oil spills"⁶. The number of the liquid based HCR incidents where a quantity of hydrocarbon liquid was released to the sea in 2010/11 was very small - seven in total – with the amounts ranging from minimal to 500kg.

4.6 The combined number of major and significant (73) HCRs in 2010/11 was a notable reduction compared to the previous year (85) and returned to the levels reported in 2005/6 (73), 2006/07 (74) and 2007/08 (74).

4.7 The number of minor releases fell by 7.8% in 2010/11 (94) compared to 2009/10 (102).

⁵ 'Severity Classification' guidance for Major, Significant and Minor HCRs can be found on the HSE website at https://www.hse.gov.uk/hcr3/help/help_public.asp

⁶ Dept. of Energy and Climate Change (DECC) Petroleum Operations Notice 1 (PON1) report form is used by operators to report all releases of oils and chemicals of whatever size to sea from offshore installations and pipelines under the Offshore Petroleum Activities (Oil Pollution Prevention and Control) Regulations 2005 (OPPC)(as amended) and Offshore Chemicals Regulations 2002 (OCR) (as amended) to DECC and other authorities. For details of spills to sea refer to DECC.

4.8 Overall, the total number of releases of all severities reported on Form OIR/12 in 2010/11 (167) fell by 10.7% compared to 2009/10 (187).

4.9 Hydrocarbon gas releases accounted for 64.4% of all major and significant releases in 2010/11 compared to 75% the previous year. There were six reported major gas releases in 2010/11 (defined as being greater than 300kg gas and having the potential to quickly impact outside the local area and be likely to cause a 'Major Accident' as defined in the Offshore Installations (Safety Case) Regulations 2005). Larger gas releases pose a significant risk of escalation to a more serious event, if ignited, due to the greater migration potential of gas clouds to other areas of an installation compared to an accumulated (pool of) liquid release. 30.1% of the combined total of all types of major and significant HCRs were major or significant gas releases greater than 25kg and 16.4% were gas releases greater than 100kg. The classification of a hydrocarbon release incident as 'Significant' or 'Major' implies the potential for that release, if ignited, to directly cause or escalate to an event severe enough to be viewed as a 'Major Accident'. Emergency action is normally required to be taken to limit the potential consequences of ignition of a reportable leak of hydrocarbon.

OTHER KEY INDUSTRY PERFORMANCE INDICATORS (KPIs)

Hydrocarbon releases are regarded as potential precursors to major accidents if ignited, and HSE monitors the number of major and significant hydrocarbon releases as a KPI of the offshore industry's effectiveness of process health and safety management on offshore installations.

Annex 2 provides supplementary information relating to activity that the offshore industry representative body Oil and Gas UK have been undertaking in respect of additional KPI monitoring activities. This monitoring activity is not undertaken by HSE and is included in this report for information only in the context of providing a more complete picture of UK offshore KPI monitoring processes undertaken by both HSE and the industry.

Annex 2

OIL AND GAS UK (OGUK) - KEY INDUSTRY PERFORMANCE INDICATORS

The following information has been produced by OGUK for inclusion in this annual statistics report. Queries relating to the information contained below should be directed to OGUK.

The UK offshore oil and gas industry has a voluntary asset integrity KPI scheme in place; data have been collected since 2008. The scheme is administered by Oil & Gas UK and collates data from 24 duty holders covering 210 installations. Forums to discuss the KPI trends and to promote the development of KPIs are also conducted on a quarterly basis. The three current cross industry asset integrity related KPIs are:

- KPI-1: Hydrocarbon Releases;
- KPI-2: Verification Non-Compliance;
- KPI-3: Safety-Critical Maintenance Backlog.

KPI-1 is clearly a lagging indicator and is also monitored by HSE through incident reporting mechanisms. KPI-2 and KPI-3 serve as leading indicators looking at performance relating to safety-critical elements. They enable the industry to monitor and measure a key aspect of its overall effort/status in relation to asset integrity management.

1. KPI-2 Verification Non-Compliance

For production installations the verification process is performed by Independent Verification Bodies. Their verification findings were ranked as levels 1, 2 and 3 with broad consistency in those classifications. KPI-2 monitors and measures levels 2 and 3 non-compliances; those being the more significant findings. The graph below shows the level 2 findings per installation.

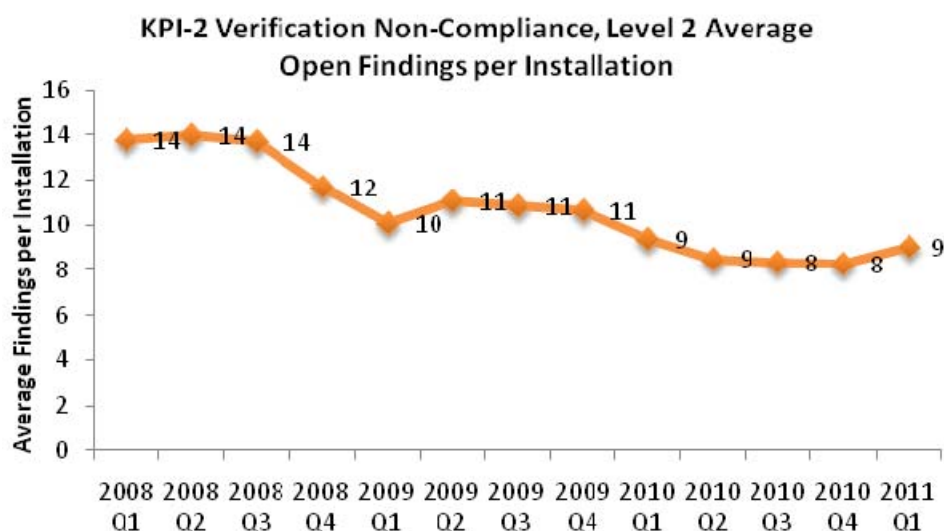

Figure 1. Average level 2 findings per installation (2008 – Q1 2011)

Level 2 findings have decreased by 36% in the period, improving from 14 to 9 open findings per installation. Sustained effort is applied to further improve this performance and to progress from the evident plateau shown in the graph.

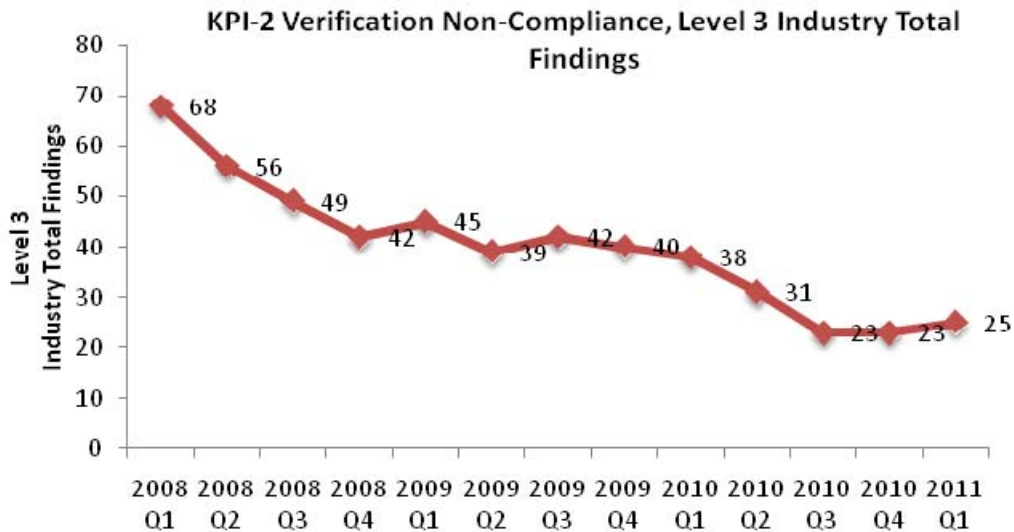

Figure 2. KPI-2 Verification Non-Compliance: level 3 industry total findings (2008 – Q1 2011).

The level 3 findings represent relatively more serious matters of concern identified by the Independent Verification Bodies. As might be expected, the average level 3 findings per installation are very small so the total number of level 3 across all 210 contributing installations is monitored. Over the period, the industry has consistently reduced the number of level 3 findings from 68 to 25 (a 63% improvement). As is the case for level 2 non-compliances, the industry continues to focus effort and attention on this critical area of performance and to further drive down the number of level 3 non-compliances.

2. KPI-3 Safety Critical Maintenance Backlog

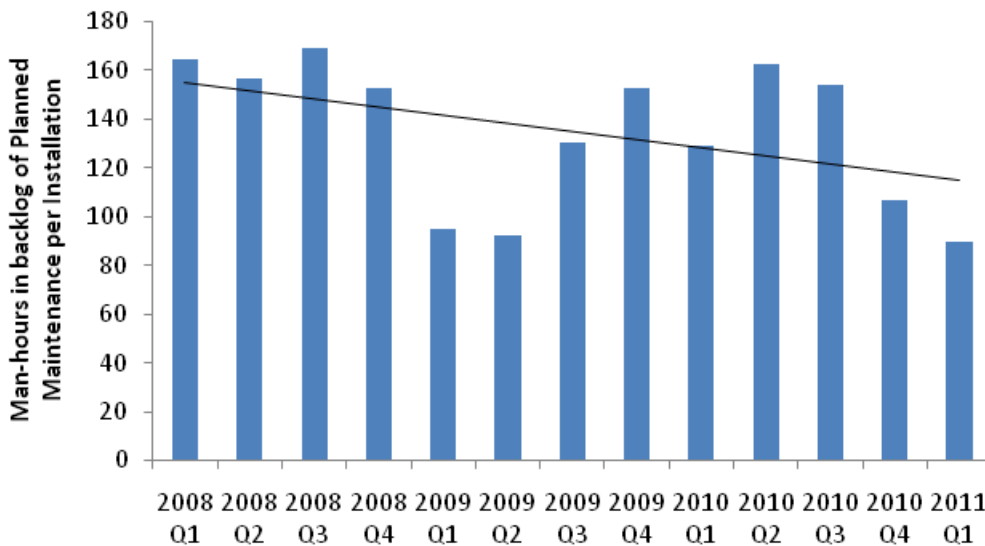

Figure 3. KPI-3 Safety Critical Maintenance Backlog – planned maintenance (2008 – Q1 2011).

KPI-3 produces a report of the total number of backlog man-hours for planned safety-critical maintenance that is beyond its planned completion date. This excludes backlog maintenance that has been subject to a formal and robust deferral process involving relevant technical or engineering authorities. This data

collection also covers 24 duty holders and 210 installations. As can be seen in Figure 3, the data shows a seasonal (cyclic) nature probably reflecting campaign maintenance patterns (e.g. planned major maintenance shutdowns). Nonetheless the data set shows an overall improvement over the past three years. The KPI work group managed by Oil & Gas UK is currently reviewing KPI-2 and KPI-3 with a view to refreshing and improving the indicators. Two sub-groups have been formed to carry out the reviews and to make recommendations to the main work group with a view to implementation of revised KPIs in 2012.
