This information will help employers, the self-employed and contractors comply with the Control of Substances Hazardous to Health Regulations 2002 (COSHH), as amended, to control exposure and protect workers’ health.

It is also useful for trade union safety representatives.

This sheet describes good practice using RPE with engineering controls.

It covers the key points you need to follow to help reduce exposure to an adequate level.

It is important to follow all the points, or use equally effective measures.

See also sheet AG11, Cleaning stores, sheds and silos.

Main points

- High dust levels can be produced from dry feed.
- Keep exposure as low as possible using all the controls in this sheet.
- Health surveillance is usually needed - see sheet G402.

Control approach R

Respiratory protective equipment (RPE)

Hazard

✓ Dust is produced from natural and compound feeds and from animal dander. These can cause lung diseases such as asthma.
✓ Control exposure to stop occupational lung diseases developing - this means short-term as well as long-term exposure.
✓ If an individual develops occupational asthma, avoid further exposure.

Access and premises

✓ Only allow access to trained people.

Equipment and procedures

✓ Automate feeding where possible - use enclosed elevators, conveyors or an auger.
✓ Use pelletised or slurry feeds, which produce less dust.
✓ Where manual feeding cannot be avoided, pour feed gently - don’t throw or dump it.

Respiratory protective equipment (RPE)

✓ RPE is needed where breathing dust is unavoidable.
✓ Powered or air-fed RPE is more comfortable to wear.
✓ Select RPE that suits the wearer, the job and the work environment.
✓ Use RPE with an assigned protection factor (APF) of at least 10. See sheet R2.
✓ Disposable RPE, type FFP2, is acceptable. Don’t use ‘nuisance dust’ masks.
✓ Make sure that RPE fits properly - get advice from your supplier or read the instructions on the box.
✓ Train workers to check their RPE works properly before use and to put it on before entering the shed.
✓ Replace RPE filters as recommended by the supplier. Throw away disposable RPE at the end of the day, or sooner if heavily soiled.
✓ Keep RPE clean and store it away from dust.

Maintenance, examination and testing

✓ Follow instructions in maintenance manuals - keep equipment in effective and efficient working order.
✓ Look for signs of damage and make repairs.
✓ Examine and test non-disposable RPE thoroughly at least once every three months.
✓ Keep records of all examinations and tests for at least five years.
Cleaning and housekeeping

- At least once a day, clear up waste.
- Use gentle shovelling and a Type H vacuum cleaner fitted with a HEPA filter, or wet clean to avoid stirring up dust.
- Store empty bags outside the workroom.

Caution: Don’t use a brush or compressed air, and never use compressed air to remove dust from clothing.

Health surveillance

- There is a chance of asthma developing, even with good controls in place. Use health surveillance - see Sheet G402.
- Ask an occupational physician for advice - see ‘Useful links’

Training and supervision

- Tell workers that feed and animal dust can cause lung diseases including asthma. Show them this sheet.
- Working in the right way and using the controls correctly is important for exposure control. Train and supervise workers. See sheet AG0.
- Ensure that health surveillance is carried out on everyone that needs it.

Employee checklist

☐ Is your RPE working properly?
☐ Look for signs of leaks, wear and damage.
☐ If you find any problems, get them fixed. Don’t just carry on working.
☐ Co-operate with health surveillance.
