Composting

COSHH essentials for agriculture

The Control of Substances Hazardous to Health Regulations 2002 (COSHH) require employers to ensure that exposure is prevented or, where this is not reasonably practicable, adequately controlled. This guidance gives practical advice on how this can be achieved by applying the principles of good practice for the control of exposure to substances hazardous to health, as required by COSHH.

It is aimed at people whose responsibilities include the management of substances hazardous to health at work (eg occupational health specialists, anyone undertaking COSHH assessments, supervisors and is also useful for trade union and employee safety representatives). It will help you carry out COSHH assessments, review existing assessments, deliver training and supervise activities involving substances hazardous to health.

This guidance is issued by the Health and Safety Executive. Following the guidance is not compulsory, unless specifically stated, and you are free to take other action. But if you do follow the guidance you will normally be doing enough to comply with the law. Health and safety inspectors seek to secure compliance with the law and may refer to this guidance.

See Essential information near the end of the sheet.

Control approach 2  Engineering control

What this sheet covers
This sheet describes good control practice when composting.

It covers the key points you need to follow to reduce exposure to an adequate level. Follow all the points, or use equally effective measures.

Hazards
✓ High dust levels can be produced when moving compost.
✓ Bioaerosols (aerosols of dust and micro-organisms) are produced by compost shredding, windrow turning, screening and transfer. These can cause lung diseases such as asthma. Bioaerosols are too small to see.
✓ Control exposure to stop occupational lung diseases developing – this means short-term as well as long-term exposure.

Access to work area
Allow access to authorised and appropriately trained people only.

Equipment and procedures

Vehicles
✓ Where reasonably practicable use a vehicle with an enclosed, ventilated cab fitted with filtered air intakes.
✓ Check that the clean air is turned on and working.
✓ Check any air conditioning. Self-test every time you start the vehicle.
✓ Keep doors and windows closed.
✓ If this is not possible, wear RPE for moving compost.

Conveyors
✓ Apply local exhaust ventilation (LEV) at the source of the exposure to capture the airborne contaminant and enclose the process as much as possible, eg use enclosed or extracted elevators, conveyors and screens.
✓ Airflow must be sufficient to control airborne contaminants effectively. This will depend on the design, size of opening and the type of process and substance being controlled.
✓ Provide an easy way of checking the LEV is working, eg an airflow indicator or equivalent.
✓ Mark the acceptable range of readings on the gauge.
✓ Keep extraction ducts short and simple – avoid long sections of flexible duct.
✓ Discharge extracted air to a safe place away from doors, windows and air inlets.
Respiratory protective equipment (RPE)

- RPE is normally not needed if the extraction and dust enclosures are working properly.
- Provide RPE for maintenance and cleaning inside the machinery, or where dust clouds are unavoidable.
- Provide RPE with a UK Standard Assigned Protection Factor (APF) of at least 10.
- Fit testing is required for RPE with a tight fitting face seal.
- Workers wearing tight fitting RPE must be clean shaven, trained how to fit it properly and look after it.
- Tell workers to discard disposable RPE at the end of the shift, or sooner if their RPE becomes blocked with dust.
- Change the filters on respirators in accordance with manufacturers’ recommendations and if:
  - the shelf-life expiry date has passed;
  - they are damaged or visibly contaminated; or
  - they become harder to breathe through.
- Examine and test non-disposable RPE thoroughly at least once every month and record this.
- Tell workers to check RPE is working properly before every use and record this.
- If RPE is required for extended periods, eg longer than 1 hour, use powered respirators.
- Make suitable arrangements for maintenance, storage and replacement of RPE.

Personal protective equipment (PPE)

- PPE should not be needed if the cab filters are working properly.
- Provide PPE for maintenance and cleaning and for dusty operations.
- Ask your supplier to help you select suitable PPE.
- Make suitable arrangements for maintenance, storage and replacement of PPE.

Personal decontamination and skincare

- Provide warm water, mild skin cleansers, and soft paper or fabric towels for drying. Avoid abrasive cleansers.
- Provide pre-work skin creams, which will make it easier to wash dirt from the skin.
- Provide after-work creams to replenish skin oils.

Caution: ‘Barrier creams’ are not ‘liquid gloves’ and do not provide a full barrier.

Maintenance, examination and testing

- Keep all equipment used for the task in effective working order. Maintain it as advised by the supplier or installer.
- Follow any special procedures before any systems are opened or entered, eg purging or cleaning. Don’t forget you may need RPE/PPE for some maintenance tasks.
- Check all equipment at least once a week for signs of damage or faults.
- For LEV systems, a user manual or log book is helpful in setting out the frequency of checking, maintenance and parts replacement.
For LEV systems with no user manual or log book, you may need the help of a competent person. They can determine the performance needed for adequate control.

Keep records of all examinations for at least 5 years.

LEV systems require a statutory ‘thorough examination and test’ (TExT).

Get a competent person to perform the TExT at least once every 14 months.

Carry out all actions arising from the TExT.

Several measures are available to check effectiveness of controls. These range from simple qualitative (use of dust lamp) to complex quantitative techniques (eg air sampling) – usually for higher risk scenarios.

HSG258 provides more detailed information on LEV systems and legal and competence requirements.

Vehicle air filtration

Plan regular checks and maintenance of the critical parts.

Every day, look for signs of damage, eg door and window seals. Repair damage immediately.

Check pre-filters regularly – keep spares.

Check that the filter seating is in good condition.

Change inlet air HEPA filters as advised by the manufacturer.

Get a competent engineer to examine the air filtration at suitable intervals.

Cleaning and housekeeping

Clean work equipment and the work area daily. Clean other equipment and the workroom regularly – at least once a week.

Vacuum dry dust or use wet cleaning methods.

Use vacuum equipment that meets at least the dust Class M (medium hazard) classification to remove dust.

Caution: Never allow the use of brushes or compressed air for removing dust from skin and clothing. Avoid the use of brushes or compressed air for removing dust from surfaces or from inside machinery.

Health surveillance

Provide health surveillance for asthma where there is a reasonable likelihood that asthma may occur in your workplace. See G402.

Training and supervision

Tell workers about the hazards associated with their work and how to recognise the early signs of asthma and dermatitis.

Provide supervision – ensure that safe work procedures are followed.

Provide workers with training on:

- working safely with hazardous substances;
- when and how to use controls;
- how to check they are working;
- how the LEV system works;
- how to use the LEV to get the best out of it;
- how to check that the LEV is working;
- what to do if something goes wrong.

Training records are helpful to demonstrate training has taken place.

publications are also available from bookshops.

Employee checklist

☐ Do you know how to use
  the control equipment
  properly?
☐ Is the in cab filtration
  working?
☐ Shut cab doors and
  windows.
☐ Look for signs of leaks,
  wear and damage before
every job.
☐ If you find any problems,
tell your supervisor. Don’t
just carry on working.
☐ Is your respirator working
  properly? Check it every
time you use it.
☐ Use, maintain and store
  your PPE and RPE
  in accordance with
  instructions.
☐ Co-operate with health
  surveillance.
☐ If you develop any
  symptoms that may be
  related to work, inform
  your supervisor.
☐ Wash hands before eating,
  drinking, smoking or using
  the lavatory and after work.
