Facing green bricks with sand

Control approach 2  Engineering control

Hazard
✓ Brick and tile making can produce airborne respirable crystalline silica (RCS).
✓ All RCS is hazardous, causing silicosis. This is a serious lung disease causing permanent disability and early death.
✓ Silicosis is made worse by smoking.
✓ ‘Respirable’ means that the dust can get to the deepest parts of the lung. Such fine dust is invisible under normal lighting.
✓ Keep inhalation of RCS as low as possible.
✓ When all controls are applied properly, less than 0.1 mg/m³ RCS is usually achievable (based on an 8-hour time-weighted average).

Crystalline silica concentrations in common materials
✓ See table in sheet BK0.

Access and premises
✓ Only allow access to authorised staff.
✓ Use CCTV to monitor the process and reduce the need for people to be there.
✓ Segregate this task as far as possible to reduce cross-contamination.

Equipment
✓ Facing bricks with sand creates dust. Fit controls to extract this dust.
✓ Use an extracted enclosure for facing.
✓ If you use compressed air, it is important that the extraction is strong enough to cope.
✓ You need an air speed between 10 and 20 metres per second into an extracted enclosure.
✓ Fit a manometer or pressure gauge near the extraction point, to show that the system is working properly.
✓ Mark the acceptable range of readings.
✓ With multiple extraction points, a simplified pressure check method may suffice.
✓ Discharge cleaned, extracted air to a safe place outside, away from doors, windows and air inlets.
Have a supply of clean air coming into the workroom to replace extracted air.
Fit an indicator or alarm to show if filters have blocked or failed.
Ensure that respiratory protective equipment (RPE) is worn for any work near the facing machine.
Consult a qualified ventilation engineer to design new control systems or to update current controls. See sheet G406.

**Procedures**
- Always confirm that the dust extraction is turned on and working before starting work.
- Clean air pre-filters daily, or follow the manufacturer’s advice.
- Shake down air filters regularly (eg every hour), or use automated reverse-jet cleaning.
- Make sure you can get spares easily.

**Maintenance, examination and testing**
- Minerals and silica-containing dusts are very abrasive. Plan regular maintenance.
- Follow instructions in maintenance manuals - keep equipment in effective and efficient working order.
- Clean down the equipment before starting maintenance - use wet or dustless methods.
- Check that filter seatings are in good condition.
- Repair faulty extraction systems immediately. Meanwhile, wear respiratory protective equipment (RPE).
- Examine and test RPE thoroughly at least once every three months.
- Daily, look for signs of damage. Make repairs.
- At least once a week, check that the dust extraction system and gauges work properly.
- You need to keep all controls in good working order. See sheet G406 for advice on engineering controls.
- You need to know the manufacturer’s specifications to check the extraction’s performance.
- If this information isn’t available, hire a competent ventilation engineer to determine the performance needed for effective control.
- The engineer’s report must show the target extraction rates.
- Keep this information in your testing log-book.
- Get a competent ventilation engineer to examine the extraction thoroughly and test its performance at least once every 14 months. See the HSE publication HSG54 - see ‘Further information’.
- Keep records of all examinations and tests for at least five years.
- Review records - failure patterns show where preventive maintenance is needed.
- Carry out air sampling to check that the controls are working well. See sheet G409.
Personal protective equipment (PPE)
- Ask your supplier to help you select the right PPE.
- Provide storage for clean and contaminated PPE.

Respiratory protective equipment (RPE)
- RPE may be needed for work near the equipment while it is running.
- RPE is often needed for maintenance and some cleaning jobs.
- Powered or air-fed RPE is more comfortable to wear.
- Select RPE that suits the wearer, the job and the work environment.
- Decide the level of protection from air sampling data. Otherwise, use RPE with an assigned protection factor (APF) of at least 20. See sheet R3.
- Disposable RPE is acceptable.
- Make sure all RPE is properly fit-tested - get advice from your supplier.
- Train workers to check their RPE works properly before use.
- Replace RPE filters as recommended by the supplier. Throw away disposable RPE at the end of the job or the end of the shift.
- Keep RPE clean.

Other protective equipment
- Provide coveralls that do not retain dust. Use synthetic fabrics - not cotton or knitted.
- Skin creams help in washing contamination from the skin. After-work creams help to replace skin oils.
  Caution: Never allow use of compressed air for removing dust from clothing.

Health surveillance
- You need health surveillance unless exposure to RCS is well below the limit. See sheet G404.
- Consult an occupational health professional - see ‘Useful links’.

Cleaning and housekeeping
- Every day, clear up accumulated waste.
- Damp down and shovel large amounts carefully to avoid stirring up dust. Provide respiratory protective equipment (RPE).
- Use a Type H vacuum cleaner fitted with a HEPA filter to clear up dust eg. on overhead fittings.
  Caution: Don’t use a brush or compressed air.

Training and supervision
- Tell workers that silica dust can cause serious lung diseases.
- Working in the right way and using the controls correctly is important for exposure control. Train and supervise workers. See sheet BK0.

- Also see www.nhsplus.nhs.uk.

Employee checklist

- Are you sure how to use all dust controls?
- Is the equipment switched off and locked off for maintenance and cleaning?
- Check your RPE works properly every time you use it.
- Is the dust extraction working? Check the gauge.
- Look for signs of leaks, wear and damage every day.
- If you find any problems, tell your supervisor. Don’t just carry on working.
- Make suggestions to improve the effectiveness of dust control.
- Co-operate with health surveillance.
- Use, maintain and store your protective equipment in accordance with instructions.
- Use skin creams provided as instructed.
