COSHH essentials for printers

This information is intended to help employers in the printing industry comply with the requirements of the Control of Substances Hazardous to Health Regulations 2002 (COSHH), as amended, to control exposure to chemicals and protect workers' health.

It is also useful for trade union safety representatives.

This sheet describes good practice for laminating with isocyanate-based products. Use extraction for isocyanate and solvent vapours.

It is important to follow all the points or use equally effective measures.

Isocyanate-based adhesives can cause dermatitis and asthma. Consider using isocyanate-free products.

Prevent exposure to substances that can cause occupational asthma. If that isn’t reasonably practicable, control exposure to stop asthma developing.

If a worker develops occupational asthma, avoid further exposure.

Main points
- Avoid skin contact and inhaling isocyanate-based products - these can cause dermatitis and asthma.
- Carry out health surveillance for asthma and dermatitis.

Access and premises

✓ Provide good facilities for washing, skin care and for taking refreshments.

Equipment

✓ Find out the curing time - see the supplier’s information, otherwise assume it is at least 24 hours.
✓ Provide a good standard of general ventilation. Use powered wall- or window-mounted fans to supply fresh air - five to ten air changes per hour, with a through draught.
✓ Provide splash-resistant gloves.
✓ Enclose the machinery as much as possible, with vapour extraction.
✓ Set the extraction running before work begins, and keep it running for at least ten minutes after the job finishes.
✓ You need an airflow between 0.5 and 1 metre per second into the machine openings.
✓ Make sure the drying/curing tunnel is kept below atmospheric pressure when in use.
✓ Fit a manometer, pressure gauge or tell-tale to show that extraction is working.
✓ Discharge extracted air to a safe place in the open air, away from doors, windows and air inlets.
Special care
✓ Avoid products containing HDI, IPDI or TDI - check the safety data sheet. If you do need to use an isocyanate-based product, choose one containing MDI, which is less volatile.

Maintenance, examination and testing
✓ Follow the instructions in the maintenance manual - keep equipment in effective and efficient working order.
✓ Noisy or vibrating fans indicate a problem. Do repairs immediately.
✓ If the machine extraction stops, or is faulty, get it repaired straightaway.
✓ Don’t alter, add or remove extraction without specialist advice.
✓ At least once a week, check that the extraction system and gauges work properly.
✓ You need to know the manufacturer’s performance specifications to know if extraction is working properly.
✓ If this information isn’t available, hire a competent ventilation engineer to determine the performance needed for effective control.
✓ The engineer’s report must show the target extraction rates.
✓ Keep this information in your testing logbook.
✓ Get a competent ventilation engineer to examine the extraction thoroughly and test its performance at least once every 14 months - see HSE publication HSG54.
✓ Keep records of all examinations and tests for at least five years.
✓ Visually check compressed air-lines for damage before use.
✓ Biological monitoring for isocyanates may be required – see sheet P47.

Personal Protective Equipment (PPE)
✓ Provide storage for PPE to prevent damage or contamination when not in use.

Respiratory protective equipment (RPE)
✓ Provide air-fed RPE for entry into the drying/curing tunnel, and for reworking outside the extracted area within the curing time. This includes clearing up rework dust.
✓ Fit a compressed air supply for RPE. Make sure the right amount of compressed air is supplied, and that it is fit to breathe.
✓ Workers must keep RPE on until they have left contaminated areas.
✓ Ensure users examine their RPE thoroughly and test that it works properly every time they use it.
✓ Check the airflow and air quality (BS 4275) for air-fed RPE at least once every three months.
✓ Provide RPE with an Assigned Protection Factor of 40 or better. Use an LDM3 air-fed half-mask or an LDH3 air-fed visor (APF 40). See sheet P50.

Gloves
✓ Use splash-resistant gloves. Single-use nitrile gloves 0.2 mm thick are acceptable for clearing web breaks.
✓ Ensure that workers wear them.
✓ Tell workers to dispose of single-use gloves every time they take them off.
**Other equipment**
✓ Wear cotton overalls to minimise clothing contamination.
✓ Change contaminated overalls immediately and ensure they are laundered before reuse.

**Asthma management**
✓ There is a chance of asthma developing, even with good controls in place.
✓ Health surveillance for occupational asthma is required. See sheet P46.
✓ Seek advice from an occupational health professional.
✓ Start surveillance for new workers within six weeks of their starting work. Then check as advised by your health professional.

**Skin management**
✓ Skin contact with isocyanates may cause dermatitis.

**Skin care**
✓ Keep hands clean and in a good condition.
✓ Using pre-work creams helps make removing chemicals easier. However, pre-work creams should not be seen as a substitute for gloves.
✓ If you need to use hand cleansers to remove ink, ensure that the cleanser is rinsed off afterwards.
✓ Provide after-work creams (moisturisers) to replace skin oils.
✓ Never allow solvents to be used for cleaning skin.

**Skin surveillance/checks**
✓ Health surveillance for dermatitis is required. See sheet P45.
✓ Seek advice from an occupational health professional in setting up a health surveillance programme.
✓ Start surveillance for new workers within six weeks of their starting work. Then check at monthly intervals or as advised by your health professional.

**Cleaning and housekeeping**
✓ Keep the work area tidy, clean and free of combustible materials.
✓ Remove wraparound solid waste outside, to cure before disposal.

**Decontamination**
✓ Store contaminated cloths, wipes and gloves in fire-resisting, closed, metal containers. Decontaminate promptly.
✓ Decontaminate empty containers and primary wash-up solvent.
✓ Dispose of waste solvent and decontaminated wipes, containers etc as hazardous waste.
✓ Use a contract laundry or a suitable equivalent to wash work clothing. Don't do this at home.
✓ Ask your supplier, or read the safety data sheet.
✓ You can use a solution of sodium carbonate (washing soda) in water, 50 g per litre. Mix with the contaminated waste and leave it to stand for a few days.
Training and supervision

✓ Working in the right way is important for exposure control. Train and supervise workers - see details in sheet P0.
✓ Warn workers about the dermatitis and asthma risks from isocyanates.

Environmental guidelines

Releases into the air may be regulated within the Pollution Prevention and Control (PPC) framework. Your local authority or the Environment Agency will tell you if PPC applies to your company, and give advice on air cleaning and discharging emissions. In Scotland, consult the Scottish Environment Protection Agency (SEPA). For more information, see http://www.environment-agency.gov.uk/netregs/sectors.

Contact the British Occupational Hygiene Society (BOHS) on 01332 298101 or at www.bohs.org for lists of qualified hygienists who can help you.

Look in Yellow Pages under ‘Health and safety consultants’ and ‘Health authorities and services’ for occupational physicians (doctors and nurses). Also see www.nhsplus.nhs.uk.

Contact the Health and Safety Laboratory at hslinfo@hsl.gov.uk for help on biological monitoring for isocyanates.

This guidance is issued by the Health and Safety Executive. Following the guidance is not compulsory and you are free to take other action. But if you do follow the guidance you will normally be doing enough to comply with the law. Health and safety inspectors seek to secure compliance with the law and may refer to this guidance as illustrating good practice.
