

Skin cancer caused by pitch and tar

This is a web-friendly version of pocket card INDG435 (formerly MSB4), first published 09/09

People who work, or have worked, with pitch and tar sometimes get warts on their faces, necks, hands, arms, or scrotum (the bag which contains the testicles).

You might get a wart after only a few months in the industry, but it usually takes years for a wart to develop.

There are several kinds of tar wart, but one of them is **cancer** and will not go away unless it is treated. It is however, easily cured by prompt treatment.

If you work in contact with pitch or tar and develop a wart or a little sore that does not heal, go to your doctor. If it occurs on the scrotum it is a serious danger and **delay is dangerous**.

The scrotum is at special risk. Examine it each time you have a bath. If you feel a patch of hard skin or a little lump, it could be a dangerous wart.

Go at once to your doctor and take this leaflet with you.

This is a tar wart on the scrotum. It is cancer and it was cured.

This is a tar wart on the eyelid. It is cancer and it was cured.

If you work with pitch or tar, **watch out for warts**.

If you used to work with pitch or tar, **watch out for warts**.

You could work with pitch or tar for many years without getting a wart, and then get one years after you leave the work, so **watch out for warts**.

General precautions

- Keep pitch and tar off your skin.
- Wear protective clothing.
- If you have a protective device, such as a dust extractor, use it.
- Change your underclothes often.
- Change your working clothes often, because tar works its way in.
- Do not put any dirty rags, tools or other materials contaminated with pitch and tar in your trouser pockets.
- Wash your hands before going to the toilet.
- Make sure that you have a bath or shower after work.
- **Watch out for warts.**
