This document is available from www.hse.gov.uk/statistics/
Key statistics in the Education sector

In Great Britain, 2018:

132,000 workers suffering from work-related ill health (new or long-standing). The rate of total self-reported work-related ill health has been broadly flat in recent years.

Source: LFS, 2017/18. Many of these illnesses were long-standing ill health conditions.

53,000 non-fatal injuries to workers each year

The rate of self-reported non-fatal injury to workers shows a downward trend.

RIDDOR is used here as the LFS is not able to provide a breakdown to this level of detail.

Proportions of reported non-fatal injuries are shown for the most common five kinds.
Introduction

This report provides a profile of workplace health and safety in the Education\(^1\) sector.

Education includes pre-primary, primary, secondary, higher, tertiary (eg university) and other education, eg sport, music, arts, driving, vocational, adult education.

The Education sector is a major employer, accounting for 10% of the UK workforce\(^2\). This report considers the current health and safety situation in the sector, focusing on:

- The scale and profile of work-related illness and injury in workers.
  
  A range of data sources is considered to allow a full assessment of the current health and safety situation.

  The most comprehensive data source for both work-related illness and workplace injury is the Labour Force Survey, a large scale, nationally representative survey of households.

  This is supplemented with a range of data from other sources (e.g. for injuries, statutory notifications of workplace injuries under the Reporting of Injuries, Diseases and Dangerous Occurrence Regulations (RIDDOR)) to ensure as complete a picture as possible.

  More details on the data sources used can be found at Annex 1.

- The impacts of health and safety failings in terms of working days lost, costs to society and enforcement action taken against employers within the sector.

---

\(^2\) Annual Population Survey, 2017
**Work-related ill health**

**All illness**

In Education:

- There were an estimated **132,000** work-related ill health cases (new or long-standing)
  - **58%** were stress, depression or anxiety;
  - **21%** were musculoskeletal disorders.
- Cases of stress, depression or anxiety account for a higher proportion of ill health cases in education than in all industries (44%). The proportion of musculoskeletal disorders is lower than in all industries (35%).

*Source: LFS, annual 2017/18*

**Education compared with other selected industries**

- Around **3.8%** of workers suffered from work-related ill health (new or long-standing cases).
- This rate is statistically significantly higher than for workers across all industries (**3.2%**).

*Source: LFS, annual average 2015/16-2017/18. 95% confidence intervals are shown on the chart.*

**Changes over time**

*Source: LFS annual, from 2001/02 to 2017/18.*
Work-related ill health
Musculoskeletal disorders

In Education there were an estimated **28,000** work-related cases of musculoskeletal disorder (new or long-standing). This is about one fifth of all ill health in this Sector.

*Source: LFS, annual 2017/18*

**Education compared with other industries**

- Around **0.9%** of workers in the sector reported suffering from a musculoskeletal disorder they believed was work-related. (New or long-standing cases).
- This rate is statistically significantly lower that the rate for workers across all industries. **(1.2%)**

*Source: LFS, annual average 2015/16-2017/18. 95%Confidence intervals are shown on the chart.*

**Changes over time**

*Source: LFS annual, from 2001/02 to 2017/18.*
Work-related ill health
Stress, depression or anxiety

In Education there were an estimated 73,000 work-related cases of stress, depression or anxiety (new or long-standing), about one sixth of all ill health in this Sector.

Source: LFS, annual average 2015/16-2017/18

Education compared with other industries

- Around 2.1% of workers in the sector reported suffering from stress, depression or anxiety they believed was work-related. (New or long-standing cases).
- Stress, depression or anxiety is more prevalent in public services, education; health and social care; and public administration and defence.
- This rate is statistically significantly higher from the rate for workers across all industries (1.3%).

Changes over time

Source: LFS annual, from 2001/02 to 2017/18
**Work-related injuries**

**Fatalities**

In Education there were:

- **one** fatal injury to workers in 2017/18;
- **seven** fatalities over the last five years.

*Source: RIDDOR, 2017/18; RIDDOR, 2013/14-2017/18*

---

**Work-related injuries**

**Labour Force Survey**

– HSE’s preferred data source for non-fatal injuries

In Education in 2017/18 there were an estimated **53,000** work-related cases of injury. Of these:

- 19% involved over three days;
- 14% over seven days absence; and

The proportion of injuries involving over three or seven days absence is lower than for all industries (33% and 26%). The proportion resulting in absence of three days or less is correspondingly higher (81% compared to 67%).

*Source: LFS, annual average 2015/16-2017/18*

**Education compared with other industries**

- Around **1.6%** of workers in this sector suffered from an injury.
- This is not statistically significantly different to the rate for all industries (1.8%).

*Source: LFS, annual average 2015/16-2017/18*
Work-related injuries

Supporting information from RIDDOR#

In Education 4,307 non-fatal injuries to employees were reported. Of these:

- 1,675 (39%) were specified injuries## and
- 2,632 (61%) were over 7-day injuries.

In all industries 26% were specified injuries.

Source: RIDDOR, 2017/18

Reported specified and over seven-day injuries to employees in Education

- Slips, trips and falls on the same level, when they result in a reportable injury, often result in a fracture and so are more likely to be reported as specified injuries.

- Lifting and handling injuries are much less likely to result in a fracture.
Work-related injuries

Occupation

Educational support assistants is the only identifiable occupation where the rate of self-reported injury is statistically significantly higher than that for all occupations. Around 5.2% report an injury compared to 1.8% for all occupations.

The rates for Teaching assistants and Secondary education teaching professionals (both around 1.8%) are not statistically significantly higher than for all occupations.

#The LFS gives the best indication of the scale of workplace injury within the sector. RIDDOR provides additional information for non-fatal injuries but needs to be interpreted with care. Non-fatal injuries are substantially under-reported, especially for the self-employed. Variations in reporting rates both between industries and over time make comparisons difficult. However, RIDDOR can be used for analysis at a detailed level not available through the LFS, for example, around the kind of incident.

###For the full list of specified injuries, see www.hse.gov.uk/riddor/reportable-incidents.htm
Impact of health and safety failings

Economic cost

Economic cost of workplace injury and new cases of work-related ill health in Education

- The total cost in 2016/17 is estimated at £1,485 million, (95% confidence interval £1,231 M - £1,738 M)
- This accounts for 10% of the total cost across all industries (£14,895 M)

Source: HSE Costs to Britain, 2016/17. Workplace injury and ill health impose costs: both financial (for example in terms of lost output and healthcare costs) and non-financial (the monetary valuation of the human cost of injury and illness in terms of loss of quality of life, and for fatalities, loss of life). Taken together, this gives the total economic cost to society. This cost is shared between individuals, employers and government/taxpayers.

Working days lost

- In Education around 2.4 million working days (full-day equivalent) were lost each year between 2015/16 and 2017/18 due to:
  - work-related illness (91%);
  - workplace injury (9%) a

Source: LFS, annual average 2015/16-2017/18

- That is equivalent to around one working day lost per worker – similar to the average days lost per worker across all industries (0.96 days).
- Assuming a full-time working year equates to 225 working days, this is equivalent to around 10,000 full-time workers being absent from the workforce for the whole year.
Enforcement

Enforcement notices issued by HSE to businesses in this Sector, 2017/18

17

Improvement Notices

2 Prohibition Notices

Provisional figures for 2017/18 show a total of 19 notices issued by HSE inspectors in Education.

- 17 were improvement notices and
- two were prohibition notices.
- 32 notices were issued in 2016/17.

There were two prosecution cases\(^*\) in 2017/18, each with a conviction for at least one offence and:

- £6,000 in total fines\(^*\)\(^*\)\(^*\) averaging £3,000 per conviction.

In 2016/17 there were 10 cases, each with a conviction for at least one offence and:

- £765,000 total fines; and
- average fines of £77,000.

Source: HSE Enforcement Data

HSE and local authorities are responsible for enforcing health and safety legislation. For the most serious offences, inspectors may serve improvement notices and prohibition notices and they may prosecute (or in Scotland, report to the Crown Office and Procurator Fiscal Service (COPFS) with a view to prosecution).

\(^*\)Cases refer to a prosecution against a single defendant. The defendant may be an individual person or a company. There may be one or more breach of health and safety legislation (offences) in each case.

\(^*\)\(^*\)\(^*\) New sentencing guidelines for health and safety offences came into force February 2016. A feature of these guidelines is that the fine is related to the turnover of organisations and, as a result, large organisations convicted of offences are receiving larger fines than seen prior to these guidelines.
Annex 1: Sources and definitions used

The Labour Force Survey (LFS): The LFS is a national survey run by the Office for National Statistics of currently around 38,000 households each quarter. HSE commissions annual questions in the LFS to gain a view of self-reported work-related illness and workplace injury based on individuals’ perceptions. The analysis and interpretation of these data are the sole responsibility of HSE.

- Self-reported work-related illness: People who have conditions which they think have been caused or made worse by their current or past work, as estimated from the LFS. Estimated total cases include long-standing as well as new cases. New cases consist of those who first became aware of their illness in the last 12 months.
- Self-reported injuries: Workplace injuries sustained as a result of a non-road traffic accident, as estimated by the LFS.

Specialist physician surveillance schemes (THOR): Cases of work-related respiratory and skin disease are reported by specialist physicians within The Health and Occupation Reporting network (THOR) surveillance schemes.

Ill health assessed for disablement benefit (IIDB): New cases of specified ‘prescribed diseases’ (with an established occupational cause) assessed for compensation under the Industrial Injuries Disablement Benefit scheme.

RIDDOR: The Reporting of Injuries, Diseases and Dangerous Occurrences Regulations, under which fatal and defined non-fatal injuries to workers and members of the public are reported by employers.

Certain types of work-related injury are not reportable under RIDDOR, hence excluded from these figures. Particular exclusions include fatalities and injuries to the armed forces and injuries from work-related road collisions.

HSE Costs to Britain Model: Developed to estimate the economic costs of injury and new cases of ill health arising from current working conditions. The economic cost estimate includes estimates of financial (or direct) costs incurred (either in terms of payments that have to be made or income/output that is lost) and the monetary valuation of the impact on quality and loss of life of affected workers.
HSE Enforcement data: The main enforcing authorities are HSE and local authorities. In Scotland, HSE and local authorities investigate potential offences but cannot institute legal proceedings and the Crown Office and Procurator Fiscal Service (COPFS) makes the final decision whether to institute legal proceedings and which offences are taken. Enforcement notices cover improvement, prohibition and deferred prohibition. Offences prosecuted refer to individual breaches of health and safety legislation; a prosecution case may include more than one offence. Where prosecution statistics are allocated against a particular year, unless otherwise stated, the year relates to the date of final hearing with a known outcome. They exclude those cases not completed, for example adjourned.

Rate per 100,000: The number of annual injuries or cases of ill health per 100,000 employees or workers.

95% confidence interval: The range of values which we are 95% confident contains the true value, in the absence of bias. This reflects the potential error that results from surveying a sample rather than the entire population.

Statistical significance: A difference between two sample estimates is described as ‘statistically significant’ if there is a less than 5% chance that it is due to sampling error alone.

**National Statistics**

National Statistics status means that statistics meet the highest standards of trustworthiness, quality and public value. They are produced in compliance with the Code of Practice for Statistics, and awarded National Statistics status following an assessment by the Office for Statistics Regulation (OSR). The OSR considers whether the statistics meet the highest standards of Code compliance, including the value they add to public decisions and debate.

It is Health and Safety Executive’s responsibility to maintain compliance with the standards expected by National Statistics. If we become concerned about whether these statistics are still meeting the appropriate standards, we will discuss any concerns with the OSR promptly. National Statistics status can be removed at any point when the highest standards are not maintained, and reinstated when standards are restored.

An account of how the figures are used for statistical purposes can be found at [www.hse.gov.uk/statistics/sources.htm](http://www.hse.gov.uk/statistics/sources.htm)

For information regarding the quality guidelines used for statistics within HSE see [www.hse.gov.uk/statistics/about/quality-guidelines.htm](http://www.hse.gov.uk/statistics/about/quality-guidelines.htm)

A revisions policy and log can be seen at [www.hse.gov.uk/statistics/about/revisions/](http://www.hse.gov.uk/statistics/about/revisions/)

Additional data tables can be found at [www.hse.gov.uk/statistics/tables/](http://www.hse.gov.uk/statistics/tables/)
