Table C1: Zoned drifter statistics
FIGURES
Figure 1.1: Bathymetry of the Faroese Channels (from DBDB5 database), showing Marine Laboratory sections and CTD locations for Figure 2.2
Figure 2.1: Principal circulation in the Faroese Channels (from Sherwin et al, 1999). Surface: black arrow – NAW; grey arrow – MNAW; broken line – surface front. Intermediate and bottom: black arrow – AI/NIW; grey arrow – NSAIW; black broken arrow - FSCBW
Figure 2.2: Potential temperature ($\theta$) during cruise 0799S along standard sections across the Faroe-Shetland Channel, regularly worked by the Marine Laboratory, Aberdeen. Upper: Fair Isle - Munken section. Lower: Nolso - Flugga (see Figure 1.1 for locations)
Figure 2.3: Representative $\theta$-$S$ profiles from the Faroese Channels (locations marked on Figure 1.1)
Figure 3.1: Track of the FRV 'Scotia', during cruise 0799S in April and May 1999. Also shown are drifter deployment locations.

Figure 3.2: Measurement locations and drifter deployment sites.
Figure 3.3: Isobaric charts for 29th April to 1st May, 1999 (source: The Met Office)
Figure 3.4: Comparison of CTD and XBT temperature profiles from co-incident station

Figure 3.5: Configuration of the Far Horizon Lagrangian drifter
Figure 3.6: AVHRR sea surface temperature at 0423hrs on 19th May 1999 (courtesy RSDAS)
Figure 4.1: Effects of interpolation on to ½-hourly time step on a complex drifter trajectory segment in the Faroe Bank Channel

Figure 4.2: Hamming and Hanning data windows, using $N = 512$ data points
Figure 4.3  Example spectra from three drifters in the WTR: Upper left – drifter 89, 969 data points; upper right – drifter 92, 771 data points; bottom – drifter 94 3061 data points

Figure 4.4: Response of the Butterworth lowpass filter (cutoff at 30 hrs)
Figure 4.5: Effects of lowpass filtering the drifter tracks: upper – unfiltered track of drifter 94 in the FBC; lower – 30 hr filtered counterpart
Figure 4.6: Verification of drogue loss

1. Raw drifter speed

2. Daily averaged 3 hr wind speed (blue) vs daily averaged 3 hr drifter speed x10 (red)

3. Variance of daily averaged drifter speed

Figure 4.6: Verification of drogue loss
Figure 5.1: Definition of the Faroes shelf water intrusion
Figure 5.2: θ-S profiles from three sites across the Faroes shelf water intrusion (see Fig. 5.1 for locations)
Figure 5.3: XBT *in-situ* temperature (°C) slices through the water column across the Faroes Shelf water intrusion
Figure 5.4  XBT *in-situ* temperature sections (°C) across the Faroe Bank Channel and plan of survey track (lower right)
Figure 5.5  Geostrophic current sections (cms$^{-1}$) across the Faroe Bank Channel, relative to the seabed or 800db whichever is the shallower, and associated current vectors at 100db (lower right). Note: positive currents are into the page.
Figure 5.6: CTD profiles from drifter deployments
Figure 5.7: Drifter trajectories in the Faroe Bank Channel from release on day 121 (1st May) to day 130 (10th May). Each dot represents a new day.
Figure 5.8 30 hour filtered drifter speeds and (where available) temperatures of drifter group released in the north and east of the deployment area.
Figure 5.9: 30 hour low pass filtered speeds and where available temperatures of remaining drifters (see also Fig. 5.8)
Figure 5.10 Filtered drifter trajectories from day 130 until entry into the Faroe-Shetland Channel (or cessation of tracking). + represents start of track segment.
Figure 5.11: Stick velocity vectors of drifters 89 and 92 during mesoscale rotation at the southern end of the FBC
Figure 6.1: 19th May AVHRR sea surface temperature image overlain by drifter tracks in the Faroese Channels.
Figure 6.2: Stick velocity vectors and accompanying temperature from drifter 90 during transit of mesoscale cell associated with meander M2

Figure 6.3: Stick velocity vectors and accompanying temperature from drifter 95 during transit of meanders in the Faroe-Shetland Channel
Figure 6.4: Stick vectors of velocity from drifters 91 and 95 during entrainment in mesoscale features in the Faroe-Shetland Channel
Figure 6.5: Normalised residence times of drifters across the Faroese Channels

Figure 6.6: Mean drifter velocity vectors across the Faroese Channels
Figure 6.7: Eddy kinetic energy \((\text{cm}^2\text{s}^{-2})\) from zoned drifter movements
Figure 7.1: Power spectra from approximately one month of NWOCE ADCP currents
Figure 7.2: Stick velocity vectors of NWOCE ADCP currents
Figure 7.3: Collage of AVHRR sea surface temperature images (courtesy of RSDAS)
Figure 7.4: Frontal mosaic map for period 18th-20th May (days 138-140), with coincident geostrophic velocity time series (cm s\(^{-1}\)) derived from 20th May altimeter track marked in blue.
Figure 7.5: Stick velocity vectors from drifters 89 and 92 during cyclonic rotation prompting the 'eddy' survey
Figure 7.6: XBT temperature slices (°C) during the 'eddy' survey, with drifter tracks overlain.
Figure 7.7: Geostrophic currents along two north-south sections during 'eddy' survey, relative to the seabed or 800m whichever is the shallower. Note: positive currents are into the page. See Fig 3.2 for measurement locations.
Figure 7.8: $\theta$-$S$ profiles along the western section during 'eddy' survey (see Fig. 3.2 for locations)
Figure 8.1: Comparison of potential vorticity ($m^{-1}s^{-1} \times 10^{11}$) across the two Marine Laboratory standard Faroe-Shetland Channel sections. Left: Fair Isle-Munken; right: Nolso-Flugga. Hatched area shows vorticity greater than 0 $m^{-1}s^{-1}$.

Figure 8.2: Configuration of Killworth et al. (1984) baroclinic instability model
Figure 8.3: Sensitivity analysis of baroclinic instability model

Figure 8.4: Time sequence photographs of the rotating tank experiments of Griffiths and Linden (1981), showing the development of baroclinic instabilities and the 'backward' breaking waves.
Figure 9.1: Power spectra from NWOCE-A (upper) and NWOCE-E (lower) ADCP currents, showing strong semi-diurnal signal (12.5 hours period)
