Key statistics

Ill health

11,000 workers suffering from work-related ill health (new or long-standing) each year averaged over the three-year period 2018/19-2020/21.

Prior to the coronavirus pandemic the rate of self-reported work-related illness showed no clear trend. The rate for the latest period, which includes years affected by the coronavirus pandemic, is not statistically significantly different from the previous period.

Source: LFS estimated annual average 2018/19-2020/21
Fatal injuries

Source: RIDDOR

Source: RIDDOR, 2016/17-2020/21. Accident kinds are shown for the top 5 causes of fatal injury.
Non-fatal injuries

12,000 Workers sustain non-fatal injuries at work each year averaged over the three-year period. Prior to the coronavirus pandemic the rate of self-reported non-fatal injury to workers showed signs of a downward trend. The rate for the latest period, which includes years affected by the coronavirus pandemic, is not statistically significantly different from the previous period.

Source: LFS, estimated annual average 2018/19-2020/21

Source: Non-fatal injuries reported under RIDDOR 2018/19-2020/21. RIDDOR is used here as the LFS is not able to provide a breakdown to this level of detail. Accident kinds are shown that account for 5% or more of injuries.
Introduction

This report provides a profile of workplace health and safety in Agriculture, forestry and fishing sector which comprises three broad industry groups:

- Agriculture – this division includes two basic activities, the production of crop products and production of animal products;
- Forestry and logging – this division includes the production of roundwood as well as the extraction and gathering of wild growing non-wood products (e.g., mushrooms, berries and nuts); and
- Fishing and aquaculture.

This sector accounts for 1% of the workforce in Great Britain.

---

1 The Agriculture, forestry and fishing sector is defined by section A within the 2007 Standard Industrial Classification. See [www.hse.gov.uk/statistics/industry/sic2007.htm](http://www.hse.gov.uk/statistics/industry/sic2007.htm) for more detail.

2 Annual Population Survey, 2020
Work-related ill health

All illness

In Agriculture, forestry and fishing:

- There were an estimated 11,000 work-related ill health cases (new or long-standing)
- 44% were musculoskeletal disorders.

Source: LFS, estimated annual average 2018/19-2020/21

Agriculture, forestry and fishing compared with other selected industries

- Around 3.6% of workers suffered from work-related ill health (new or long-standing cases).
- This rate is not statistically different than that for workers across all industries (3.7%).

Source: LFS, estimated annual average 2018/19-2020/21

95% confidence intervals are shown on the chart

---

3 Selected manual type industries are generally those with either a higher rate of work-related ill health or workplace injury compared to the rate for all industries.
Changes over time

Prior to the coronavirus pandemic the rate of self-reported work-related illness showed no clear trend. The rate for the latest period, which includes years affected by the coronavirus pandemic, is not statistically significantly different from the previous period.

![Graph showing changes over time in self-reported work-related illness rate](image)

*Shaded area represents a 95% confidence interval*

*Source: LFS annual averages (new and long-standing cases), grouped by 3 years from 2001/02, 2003/04, 2004/05. Estimates for this sector are based on a relatively small number of sample cases, resulting in wide confidence intervals; this makes trends difficult to identify*
**Musculoskeletal disorders**

In Agriculture, forestry and fishing:

- Musculoskeletal disorders was the most frequent type of work-related illness in this sector in Great Britain.

*Source: LFS, estimated annual average 2016/17-2020/21*

**Agriculture, forestry and fishing compared with other selected industries**

- Around 2.0% of workers suffered from work-related musculoskeletal disorders (new or long-standing cases).
- This rate is statistically significantly higher than that for workers across all industries (1.1%).

*Source: LFS, estimated annual average 2016/17-2020/21*

95% confidence intervals are shown on the chart.
Changes over time

Prior to the coronavirus pandemic the rate of self-reported work-related musculoskeletal disorders showed no clear trend. The rate for the latest period, which includes years affected by the coronavirus pandemic, is not statistically significantly different from the previous period.

Shaded area represents a 95% confidence interval
Source: LFS annual averages (new and long-standing cases), grouped by 3 years from 2001/02, 2003/04, 2004/05. Estimates for this sector are based on a relatively small number of sample cases, resulting in wide confidence intervals; this makes trends difficult to identify.
Other conditions

Self-reports of work-related ill health from the Labour Force Survey give the best indication of the overall scale of work-related ill health in Great Britain. However, since estimates are based on a survey, this source can be limited when looking at less common work-related ill health cases. There are a range of supporting ill health data sources to supplement the Labour Force Survey estimates, including death certificates, specialist physician surveillance schemes (THOR) and epidemiological research.

Farmers’ lung

Farmers’ lung is a common form of the condition ‘allergic alveolitis’ and arises from the inhalation of dust or spores arising from mouldy hay, grain and straw. In the period 2011-2020 there have been, on average, 7 deaths per year where farmers’ lung (or a similar condition) was recorded as the underlying cause on the death certificate. The disease only rarely progresses to a life-threatening level, suggesting that there are substantially more non-fatal cases of farmers’ lung occurring each year.

Occupational asthma

The chest physician reporting scheme for occupational respiratory disease (THORSWORD – see annex 1) suggests that while the incidence of occupational asthma in the Agriculture, forestry and fishing sector is somewhat higher than the average for all industries combined, it is not among those industries with the highest rates. However, this assessment is uncertain due to the small numbers of actual reported cases in the sector. This assessment is based on the most recent data prior to the coronavirus pandemic.

Skin disease

The dermatologist reporting scheme for occupational skin disease (THOR-EPIDERM –see annex 1) provides no clear indication that the incidence of contact dermatitis in the Agriculture, forestry and fishing sector is any higher than the average for all industries combined. This assessment is based on the most recent data prior to the coronavirus pandemic.

Occupational cancer

A research study on the occupational burden of cancer in Great Britain shows that occupational exposure to solar radiation resulted in about 1,500 non melanoma skin cancer registrations in 2004, with around 100 of these cases in workers across the Agriculture, forestry and fishing sector.
Work-related injuries

Fatalities

In Agriculture, forestry and fishing:

- There were 34 fatal injuries to workers in 2020/21.
- This compares to an annual average number of 28 fatalities over the last five years though statistically speaking, the numbers are small and prone to annual fluctuations.
- 30% of deaths over the same five-year period were classified as Struck by moving vehicle.

The fatal injury rate (8.47 per 100,000 workers) is around 20 times the all industry rate.

Source: RIDDOR, 2016/17-2020/21
Fatal injury rates for 2003/04 and earlier are not directly comparable with rates for later years due to a change in the source data used to estimate employment.

In the recent years prior to the coronavirus pandemic, the rate of fatal injury to workers showed a generally downward trend. In 2020/21 the rate was above the pre-coronavirus levels.

*Source: RIDDOR 1981 to 2020/21*
Non-fatal injuries

In Agriculture, forestry and fishing:

- There were an estimated 12,000 workers each year who sustained an injury at work.

*Source LFS, estimated annual average 2018/19-2020/21*

Agriculture, forestry and fishing compared with other industries

- Around 4.0% of workers in this sector sustained a workplace injury annually. This rate is statistically significantly higher than that for workers across all industries (1.7%).

*Source: LFS, estimated annual average 2018/19-2020/21*

95% confidence intervals are shown on the chart
**Changes over time**

Prior to the coronavirus pandemic the rate of self-reported non-fatal injury to workers showed signs of a downward trend. The rate for the latest period, which includes years affected by the coronavirus pandemic, is not statistically significantly different from the previous period.

*Source: LFS, grouped by 3 years, estimated annual average from 2000/01-2002/03 to 2018/19-2020/21*

*Shaded area represents a 95% confidence interval*
Supporting information around work-related injuries is available from RIDDOR reporting\(^4\). In Agriculture, forestry and fishing there were:

- 738 non-fatal injuries to employees reported by employers to RIDDOR in 2020/21.
- 318 (43%) were specified injuries\(^5\) and 420 (57%) were over seven-day injuries.

*Source: RIDDOR, 2020/21*

Main accident kinds for the latest three years (2018/19-2020/21)

\(^4\) The LFS gives the best indication of the scale of workplace injury within the sector. RIDDOR provides additional information for non-fatal injuries but needs to be interpreted with care since it is known that non-fatal injuries are substantially under-reported, especially for the self-employed. Possible variations in reporting rates both between industries and over time make comparisons difficult. However, RIDDOR can be used for analysis at a detailed level not available through the LFS, for example, around the kind of incident.

\(^5\) For the full list of specified injuries, see [www.hse.gov.uk/riddor/reportable-incidents](http://www.hse.gov.uk/riddor/reportable-incidents)
Enforcement

Provisional figures for 2020/21 show a total of 50 notices issued by HSE inspectors in Agriculture, forestry and fishing:

- 64% were improvement notices and;
- 36% were prohibition notices.
- This is compared to the 256 notices issued in the previous year.

There were 10 prosecution cases led by HSE or, in Scotland, the Crown Office and Procurator Fiscal where a verdict was reached in 2020/21, resulting in:

- 8 (80%) with a conviction for at least one offence;
- £66,000 in total fines averaging around £8,000 per conviction.
  - In 2019/20 there were 11 cases resulting in 11 convictions (100%). This led to £429,000 in total fines and average fines of around £39,000.

Source: HSE Enforcement Data

HSE and local authorities are responsible for enforcing health and safety legislation. For the most serious offences, inspectors may serve improvement notices and prohibition notices and they may prosecute (or in Scotland, report to the Crown Office and Procurator Fiscal Service (COPFS) with a view to prosecution).

---

6 Cases refer to a prosecution against a single defendant. The defendant may be an individual person or a company. There may be one or more breach of health and safety legislation (offences) in each case.

7 New sentencing guidelines for health and safety offences came into force February 2016. A feature of these guidelines is that the fine is related to the turnover of organisations and, as a result, large organisations convicted of offences are receiving larger fines than seen prior to these guidelines.
Annex 1: Sources and definitions

The Labour Force Survey (LFS): The LFS is a national survey run by the Office for National Statistics of currently around 37,000 households each quarter. HSE commissions annual questions in the LFS to gain a view of self-reported work related illness and workplace injury based on individuals’ perceptions. The analysis and interpretation of these data are the sole responsibility of HSE.

- Self-reported work-related illness: People who have conditions which they think have been caused or made worse by their current or past work, as estimated from the LFS. Estimated total cases include long-standing as well as new cases. New cases consist of those who first became aware of their illness in the last 12 months.

- Self-reported injuries: Workplace injuries sustained as a result of a non-road traffic accident, as estimated by the LFS.

RIDDOR: The Reporting of Injuries, Diseases and Dangerous Occurrences Regulations, under which fatal and defined non-fatal injuries to workers and members of the public are reported by employers. Certain types of work-related injury are not reportable under RIDDOR, hence excluded from these figures. Particular exclusions include fatalities and injuries to the armed forces and injuries from work-related road collisions.

Specialist physician surveillance schemes (THOR): Cases of work-related respiratory and skin disease are reported by specialist physicians within The Health and Occupation Reporting network (THOR) surveillance schemes. Reporting of respiratory disease by chest physicians is through the Surveillance of Work-Related and Occupational Respiratory Disease scheme (THOR-SWORD). Reporting of skin disease cases by consultant dermatologists is through the occupational skin surveillance scheme (THOR-EPIDER). Ill health assessed for disablement benefit (IIDB): New cases of specified ‘prescribed diseases’ (with an established occupational cause) assessed for compensation under the Industrial Injuries Disablement Benefit scheme.

Enforcement notices cover improvement, prohibition and deferred prohibition. Offences prosecuted refer to individual breaches of health and safety legislation; a prosecution case may include more than one offence. Where prosecution statistics are allocated against a particular year, unless otherwise stated, the year relates to
the date of final hearing with a known outcome. They exclude those cases not completed, for example adjourned.

Rate per 100,000: The number of annual workplace injuries or cases of work-related ill health per 100,000 employees or workers.

95% confidence interval: The range of values within which we are 95% confident contains the true value, in the absence of bias. This reflects the potential error that results from surveying a sample rather than the entire population.

Statistical significance: A difference between two sample estimates is described as 'statistically significant' if there is a less than 5% chance that it is due to sampling error alone.

National Statistics

National Statistics status means that statistics meet the highest standards of trustworthiness, quality and public value. They are produced in compliance with the Code of Practice for Statistics, and awarded National Statistics status following assessment and compliance checks by the Office for Statistics Regulation (OSR). The last compliance check of these statistics was in 2013.

It is Health and Safety Executive’s responsibility to maintain compliance with the standards expected by National Statistics. If we become concerned about whether these statistics are still meeting the appropriate standards, we will discuss any concerns with the OSR promptly. National Statistics status can be removed at any point when the highest standards are not maintained, and reinstated when standards are restored. Details of OSR reviews undertaken on these statistics, quality improvements, and other information noting revisions, interpretation, user consultation and use of these statistics is available from www.hse.gov.uk/statistics/about.htm.

An account of how the figures are used for statistical purposes can be found at www.hse.gov.uk/statistics/sources.htm.

For information regarding the quality guidelines used for statistics within HSE see www.hse.gov.uk/statistics/about/quality-guidelines.htm.

A revisions policy and log can be seen at www.hse.gov.uk/statistics/about/revisions/ Additional data tables can be found at www.hse.gov.uk/statistics/tables/.
